INSTRUCTIONS TO CANDIDATES

a) Write your name, Index number, school and sign on the spaces provided.
b) Answer ALL the questions in the spaces provide in the question paper.
c) Mathematical table and silent electronic calculators may be used.
d) All working MUST be clearly shown where necessary.

FOR EXAMINER'S USE ONLY

1. a) The diagram below shows spot of pure substances X, Y and Z on a chromatography paper. Spot Q is that of a mixture.

![Diagram of chromatography paper with spots X, Y, Z, and Q]

After development X, Y and Z were found to have moved 8cm, 3cm and 6cm respectively Q had separated into three spots which had moved 5cm, 6cm and 8cm.

i) On the diagram,
   I. Label the baseline. (1 mark)
   II. Show the positions of all the spots after development. (3 marks)
   ii) Identify the substances present in the mixture Q. (2 marks)

b) Describe how solid ammonium chloride can be separated from a solid mixture of ammonium chloride and anhydrous calcium chloride. (2 marks)

__________________________________________________________________________________________
__________________________________________________________________________________________
__________________________________________________________________________________________

2. a) Sodium hydroxide pellets were accidentally mixed with sodium chloride-18.2g of the mixture were dissolve in water to make one liter of solution. 100cm$^3$ of the solution was neutralized by 50cm$^3$ of 0.45M Sulphuric acid.

i) Write an equation for the reaction that took place. (1 mark)

__________________________________________________________________________________________

Use the information given to answer the questions that follow:

i) Name the method that can be used to separate A and C from a mixture of the two. (1 mark)

ii) Describe how a mixture of B and D can be separated. (2 marks)

__________________________________________________________________________________________
__________________________________________________________________________________________

2. a) Sodium hydroxide pellets were accidentally mixed with sodium chloride-18.2g of the mixture were dissolve in water to make one liter of solution. 100cm$^3$ of the solution was neutralized by 50cm$^3$ of 0.45M Sulphuric acid.

i) Write an equation for the reaction that took place. (1 mark)
ii) Calculate the;
   I. Number of moles of the substance that reacted with sulphuric acid. (1mark)

   II. Number of moles of the substance that would react with sulphuric acid in the one litre of solution. (1mark)

   III. Mass of the unreacted substance in the one litre of solution. (2marks)

   \( (H = 1.0, \text{Na} = 23.0, \text{Cl} = 35.5, \text{O} = 16.0) \)

b) The diagram below shows an incomplete set-up used to prepare and collect ammonia gas.

   ![Diagram of solid P and potassium hydroxide with heat applied]

   i) Name solid P. (1mark)

   ii) Complete the diagram to show how a dry sample of ammonia gas can be collected. (3marks)

c) In an experiment, excess ammonia gas was passed over heated copper (II) oxide in a combustion tube.

   i) State the observation that was made in the combustion tube at the end of the experiment. (1mark)

   ii) What property of ammonia is shown in the above reaction? (1mark)

   iii) Give one use of ammonia. (1mark)

3. a) An atom \( Z \) can be represented as \( _{19}^{39}Z \)

   What does the number 39 represent? (1mark)

   b) Study the information in the table below and answer the questions that follow. (Letters are not the actual symbols of the elements).
i) Write the formula of the compound formed when P reacts with Q. Atomic numbers are:
(P = 17, Q = 20)

...........................................................................................................................................................
...........................................................................................................................................................

ii) Identify the elements which belong to the third period of the periodic table. Explain.

...........................................................................................................................................................
...........................................................................................................................................................

iii) Which of the elements identified in b(ii) above comes first in the third period?

...........................................................................................................................................................
...........................................................................................................................................................

iv) Select two elements which are non-metals.

...........................................................................................................................................................
...........................................................................................................................................................

c) The table below gives some properties of substances A, B, C and D. Study it and answer the questions that follow;

<table>
<thead>
<tr>
<th>Substance</th>
<th>Electrical conductivity</th>
<th>MP (°C)</th>
<th>BP (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Solid: Does not conduct, Molten: Conducts</td>
<td>701</td>
<td>1320</td>
</tr>
<tr>
<td>B</td>
<td>Solid: Conducts, Molten: Conducts</td>
<td>550</td>
<td>1100</td>
</tr>
<tr>
<td>C</td>
<td>Solid: Does not conduct, Molten: Does not conduct</td>
<td>1600</td>
<td>2100</td>
</tr>
<tr>
<td>D</td>
<td>Solid: Does not conduct, Molten: Does not conduct</td>
<td>113</td>
<td>440</td>
</tr>
</tbody>
</table>

i) What type of bonding exists in substances A and B?

A ..............................................................
B ..............................................................

ii) Which substance is likely to be sulphur? Explain

...........................................................................................................................................................
...........................................................................................................................................................

4. a) The flow chart below shows a sequence of reactions starting with iron. Study it and answer the questions that follow;

Iron (III) chloride ⊳ Iron (Step 1)

Dilute hydrochloric acid ⊳ Pale green solution (Step 2)

Hydrogen peroxide ⊳ Yellow solution (Step 3)

Oxygen ⊳ Solid T/heat Step 4 (Brown solid S)

i) Hydrogen sulphide ⊳ Filter Step 3 (Aqueous sodium hydroxide)

ii) Filter Step 3 (Brown precipitate)
i) Name the reagents and state the condition for the reaction in Step 1. (2 marks)

Reagent .................................................................
Condition .............................................................

ii) Give the names of the following. (3 marks)

I. Solid S .................................................................
II. Solid V .................................................................
III. Solid T .................................................................

iii) Give reasons for the colour change in step 2. (2 marks)

........................................................................................................
........................................................................................................

iv) Write an ionic equation for the reaction which takes place in step 3. (1 mark)

........................................................................................................
........................................................................................................

v) Name one other substance that could be used instead of sodium hydroxide in Step 3. (1 mark)

........................................................................................................

b) In an experiment, 3.36g of iron fillings were added to excess aqueous copper (II) sulphate. Calculate the mass of copper that was deposited. (Cu = 63.5, Fe = 56.0) (3 marks)

........................................................................................................
........................................................................................................
........................................................................................................
........................................................................................................
........................................................................................................

5. The table below shows the variation of solubility of substances P and Q in g/100gH₂O with temperature (°C).

<table>
<thead>
<tr>
<th>Temperature</th>
<th>0</th>
<th>20</th>
<th>40</th>
<th>60</th>
<th>80</th>
<th>100</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solubility of P (g/100g of water)</td>
<td>10</td>
<td>15</td>
<td>20</td>
<td>40</td>
<td>63</td>
<td>100</td>
</tr>
<tr>
<td>Solubility of Q (g/100g of water)</td>
<td>30</td>
<td>34</td>
<td>37</td>
<td>40</td>
<td>44</td>
<td>48</td>
</tr>
</tbody>
</table>

a) i) Using the information above plot a graph of solubility of P and Q against temperature on the graph paper provided. (5 marks)
ii) What is observed when a solution containing 30g of P in 100g of water is cooled from 80°C to 10°C. (1mark)

iii) Calculate the mass of substance P that saturate 25g of water at 92°C. (2marks)

b) i) At what temperature do substances P and Q have the same solubility? (1mark)

ii) How would you make a saturated solution containing 35g of substance Q? (2marks)

c) Given a mixture containing 45g of P and 45g of Q dissolved in 100g of water, how would you obtain a pure sample of substance Q? (2marks)
6. Study the flow chart below and answer the questions that follow.

a) Identify reagent S. (1mark)

b) Write the equation for the reaction taking place in Step 1. (1mark)

c) Identify substance K. (1mark)

d) What name are given to processes below;
   i) Process in Step 3. (1mark)
   ii) Step 2. (1mark)

e) State two conditions necessary for step 2. (2marks)

f) Write the equation for the reaction in Step 3. (1mark)

g) Draw the structural formula of gas H. (1mark)
h) Describe one chemical test that can differentiate gas H from ethane gas. (3 marks)

7. a) Define enthalpy change. (1 mark)

b) Use the following bond energies to answer the questions that follow:

<table>
<thead>
<tr>
<th>Bond</th>
<th>Bond energy kJ/mol</th>
</tr>
</thead>
<tbody>
<tr>
<td>C – H</td>
<td>413</td>
</tr>
<tr>
<td>Cl – Cl</td>
<td>239</td>
</tr>
<tr>
<td>C – Cl</td>
<td>346</td>
</tr>
<tr>
<td>H – Cl</td>
<td>428</td>
</tr>
</tbody>
</table>

i) Write a balanced equation for the reaction between chlorine and methane to give chloromethane. (1 mark)

ii) Calculate the enthalpy change for the reaction leading to formation of chloromethane from chlorine and methane. (3 marks)

iii) Write the thermochemical equation for the reaction. (1 mark)

iv) List three factors to consider when choosing a fuel. (3 marks)
